PANEL FOR PARKINSON DISEASE TESTING:

With the help of Genetic testing, decision making process and planning for the future treatment, research study and psychosocial counseling for the patients starts triggered. Patients' family members can also be tested to identify their risk level. Both Pathogenic or likely pathogenic variants are tested since 50% more likely risk exists if pathogenic variant is identified.

Alzheimer-Dementia- Parkinson Panel:

The panel for Alzheimer-De- mentia-Parkinson Panel examines 30+ genes associated with an augmented risk of developing neurodegenerative conditions: Parkinson's disease, Alzheimer's disease, and genetic disorders that cause dementia.

Alzheimer-Dementia Parkinson Panel:

The panel for Alzheimer-De- mentia Panel examines 15+ genes associated with an amplified risk of developing neurodegenerative conditions: Parkinson's disease, Alzheimer's disease, and genetic disorders due to which, dementia occurs.

Alzheimer's Disease:

- Preclinical/Mild stage mostly known as Early stage.
- Moderate stage where people face greater degree of cognitive inabilities
- Severe (commonly known as Late-stage)

WHAT IS PARKINSON'S DISEASE?

Parkinson's disease affects the movement of one's body. It is a nervous system disorder which starts gradually with a lesser severe tremor affecting one hand or a leg or foot. It is often misunderstood with the stiffness of muscle as during the early stages of Parkinson's disease, your face might not show certain expressions. While walking, your arms might not go in flow with the body and your speech might become slurred with the passage of time. With the passage of time, condition becomes worst with affect spreading over entire body. Although it is not a curable disease but in time diagnosis and right medications may stop its spread and might improve the symptoms significantly over the time.
